

# BATTERY SUPPORT MADE EASIER AND SAFER WITH THE GYS LIFT MOUNTED BATTERY SUPPORT UNIT

**W**ith the ever-increasing power demands of the modern vehicles during key on / engine off diagnostic work, the risks from relying on the battery are high. This is no longer 'news' to the

technician and GYS has been at the forefront of providing advanced battery support units with the GYSFlash range for some years to solve problems during diagnostic and servicing work. As the complexity of vehicle electronics is constantly increasing the demand for battery support becomes not only more critical but is necessary for ever more routine servicing tasks. GYS has added a new format of product to the range, one that it says is designed to be fitted directly to each vehicle lift in the workshop.

Neil Pulsford, Commercial Director at GYS, said: "Today technicians that are correctly protecting vehicles with the use

of battery support would typically locate their battery support unit with their diagnostic equipment, perhaps on the same trolley. Such is the importance of battery support now even in some of the most routine maintenance tasks we would invite workshops to consider locating a battery support unit on each ramp, so that support is always available for every vehicle."

The GYSFlash 102.12 is designed to easily fit to the lift, and without the need for any drilling.

#### What is a battery support unit?

A battery support unit supports the battery by instantaneously meeting the current draw and at the same time regulating

the voltage at a contact level. Products in the GYS Flash range also allow the adjustment of that voltage to meet the requirements of specific manufacturers.

The unique vertical mounted battery support unit is ideal to be positioned on lifts with no hanging cables, according to GYS. The unit can be attached magnetically without need for screwing into the lift. GYS advises that when a garage installs a new ramp is also an excellent time to add the GYSFlash.
